GraniteWMS Functionality Cheat Sheet

GRANITE
WAREHOUSE MANAGEMENT SYSTEM

Adding a barcode-based WMS to your accounting solution will allow you to deliver products accurately with zero mistakes.

GET IT RIGHT with Granite

GraniteWMS Enhances your ERP's Functionality

Stock Accuracy	Manual stock counting, writing down codes and quantities and ticking off lines to be captured later is just not accurate when receiving, picking, or moving stock around.	GraniteWMS brings accuracy to the process. Barcode scanning with immediate validation ensures both accuracy and speed. Label printing immediately identifies and tracks items.
Item and Location Management	Enterprise level business systems are just not built with the focus of a WMS system. Bin management and pick and pack management are useful but limited.	GraniteWMS manages locations at any level of granularity. Simply validate product type, size, weight, and suitability for a bin, brings bin management to life. It is live as the work happens.
Transaction Tracking	Managing people, productivity and KPI's in the warehouse requires active tracking of all inventory transactions.	GraniteWMS tracks every user, item, and transaction. From when a person signs on, to every physical transaction they perform including moving, picking, packing, counting and adjusting stock, all interactions are tracked and managed.
Item Traceability	Traceability to visible stock – boxes, pallets, or individual items – is only possible if every item is physically scanned when handled.	GraniteWMS tracks every physical item, box or pallet with a unique tracking entity. Every time a transaction involves an item, it is scanned recorded and reported against.
Batch and Expiry Management	Tracking batch numbers, expiry dates and serial numbers is possible but requires manual capturing into the ERP afterwards and is prone to inaccuracy.	GraniteWMS manages batch and expiry as well as serial numbers by linking these to the physical tracking entity. The item box or pallet being tracked can be checked to ensure that the oldest (i.e. FEFO or FIFO) is scanned before it is moved or shipped.
